Sales & Marketing Performance Analysis

Executive Summary | Period: January 2025 – September 2026 | 450 Orders Analyzed

---

- Total Revenue: **NGN 18,179,600**
- Total Orders: **450**
- Overall ROAS: **31.70x**
- Total Ad Spend: **NGN 573,456**
- Average Order Value: **NGN 40,399**

1. Marketing Channel Performance

Instagram leads across every measure: highest ad spend (NGN 160,599.62), highest revenue (NGN 3,986,050), and the highest ROAS of all channels. Facebook follows closely behind with a comparable ROAS. Google Ads has the lowest ROAS among paid channels and is the only channel where returning customers outnumber new ones (35 vs 33), suggesting it may function more as a retention channel than an acquisition one.

> *Recommendation: Maintain current Instagram spend rather than scaling it blindly. Test a modest Facebook budget increase. Investigate Google Ads' role in the customer journey before adjusting its budget.*

2. Customer Acquisition

Across the full 20-month period, new customers slightly outnumber returning ones (54% vs 46%), indicating a reasonably healthy balance between growth and retention.

3. Regional Performance

Lagos generates the most revenue (NGN 6,171,750), followed by Abuja and Ibadan. Kano and Port Harcourt trail behind the other regions.

> *Recommendation: Lagos and Abuja remain the core revenue regions. Further research is needed to understand what is limiting performance in Kano and Port Harcourt before committing expansion investment there.*

4. Product Performance

All five product tiers (Premium, Pro, Starter, and both add-ons) have nearly identical order volumes (86–95 orders each), yet revenue varies more than twelvefold between them. This gap is driven entirely by price, not by differences in customer preference.

> *Recommendation: Do not interpret Premium's revenue lead as stronger demand. Upsell strategy should focus on moving existing buyers toward higher tiers rather than assuming organic preference for Premium.*

5. Year-over-Year Pace (2025 vs 2026)

Comparing the same eight complete months (January–August) for both years, 2026 is tracking slightly ahead of 2025: NGN 7,521,600 versus NGN 7,391,200, a lead of roughly NGN 130,400. The lead is not consistent across every month (July notably favored 2025), so this should be read as a modest overall edge rather than a strong upward trend.

6. Data Preparation Summary

The underlying dataset (470 raw records) was cleaned prior to analysis: 17 exact duplicate rows were removed, 6 duplicate order IDs with conflicting data were resolved by verifying against the revenue formula, missing values in Region, Marketing Channel, and Sales Rep were labeled rather than deleted to preserve usable data, and inconsistent date formats were standardized. 450 verified records remained for analysis.

Limitations

The dataset does not include a customer identifier linking individual orders to the same customer. As a result, questions regarding add-on purchases by plan tier could not be reliably answered and were excluded from this analysis. A small number of orders (7) had an unattributed marketing channel; these were included in totals but excluded from channel-level comparisons. Data cleaning was performed manually for this analysis; the workbook is not yet configured to automatically reapply cleaning steps to newly added data (planned as a Power Query migration in a future iteration).

Prepared as part of a sales & marketing data analysis exercise. All figures reflect cleaned, verified order-level data.
